

LESSONS IN MOOD LIGHTING

How to strategically use the color temperature of your lighting to your advantage in the office.

SPACES FOR CREATING

Using a blue, or cooler-toned light (4600K+) in ideation or brainstorming spaces will keep occupants invigorated and excited.

SPACES FOR PRESENTING

Supplying light in the mid-range of the Kelvin scale (3100K-4600K) for conference or instructional rooms will help the audience feel more alert and connected.

SPACES FOR ENGAGING

To foster a sense of trust that will encourage interaction, use a warmer light temperature (< 3000K) in collaboration areas, such as meeting rooms.
